WHAT IS CLAIMED IS:

1. A positioning system for a moveable platform comprising:

at least one active array comprised of at least one light emitting element for transmitting a binary encoded identification positioned at a known location;

at least one camera for acquiring an image of said at least one active array;
means for receiving said binary encoded identification from said image;
means for processing said image to determine the position of said active array
with respect to said moveable platform; and
means for combining said received binary encoded identification and said
determined position to calculate a position of said moveable platform.

- 2. The apparatus of claim 1 wherein said at least one camera is affixed to said moveable platform and said at least one active array is affixed to a doorframe.
- 3. The apparatus of claim 2 wherein said moveable platform is an elevator.
- 4. The apparatus of claim 1 wherein of said at least one light emitting elements are selected from the group consisting of a Light Emitting Diode (LED), an IR light emitter, a visible light emitter, and a UV frequency light emitter.
- 5. The apparatus of claim 1 additionally comprising a database in which is stored position information of each of said at least one active array.
- 6. A method for determining a position of a moveable platform comprising the steps of:

 providing a plurality of active arrays at fixed positions each active array

 comprising at least one light emitting element for transmitting a binary

 encoded identification;

affixing at least one camera to a moveable platform;

imaging at least one of said plurality of active arrays with said at least one camera to produce an image;

performing image processing on said image to receive said binary coded identification and to determine a position with respect to said moveable platform; and

combining said binary coded identification with said position of said active array to determine a location of said moveable platform.

- 7. The method of claim 1 wherein providing said plurality of active arrays comprises providing said at least one light emitting elements selected from the group consisting of a Light Emitting Diode (LED), an IR light emitter, a visible light emitter, and a UV frequency light emitter.
- 8. The method of claim 1 comprising the additional step of retrieving a position of said active array from a database using said binary encoded identification.
- 9. The method of claim 1 wherein said affixing said at least one camera to a moveable platform comprises affixing said at least one camera to an elevator.
- 10. The method of claim 1 comprising the additional step of dynamically configuring at least one of said active arrays.
